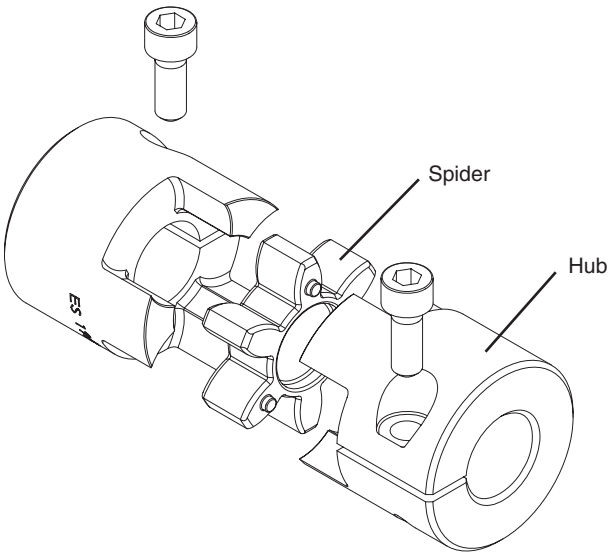
TRASCO® ES: “0” backlash coupling

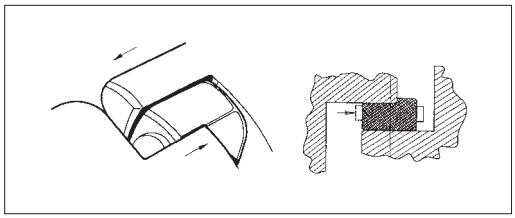
TRASCO® ES is our zero backlash coupling designed to compensate for misalignment and vibration dampening for indexing applications. The compact design of TRASCO® ES makes it the right choice for all precise motion applications.

Description

The TRASCO® ES consists of two hubs, which are either made of high-strength aluminum (up to the 38/45 size) or steel (from size 42) that are connected with an elastic element.
The precise dimensional characteristics of TRASCO® ES are obtained through our accurate machining process.
The special compound polyurethane elastic element, developed through extensive research and laboratory testing, is made through a press-forming process which guarantees high dimensional accuracy.

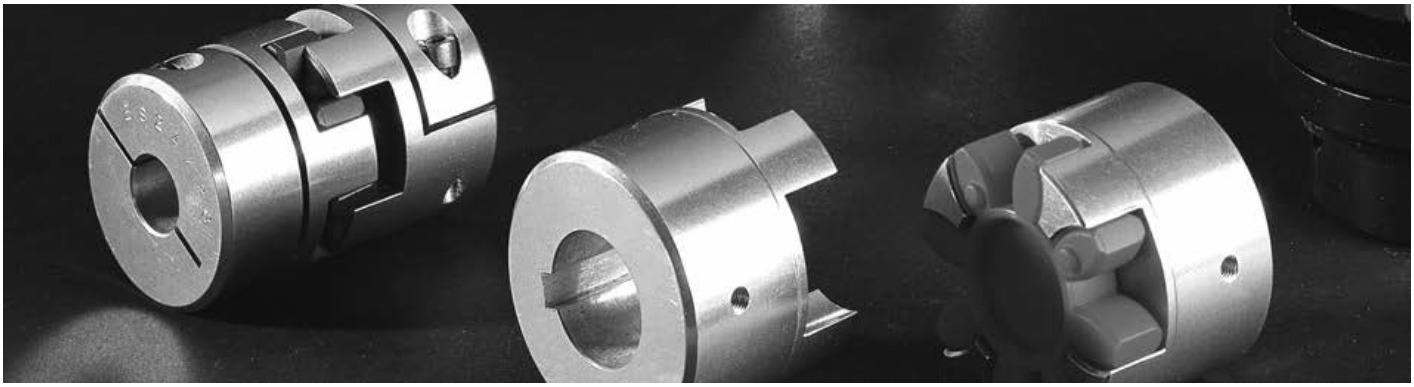
The element is available in 4 different hardnesses: **80 Sh. A (blue)**, **92 Sh. A (yellow)**, **98 Sh. A (red), 64 Sh. D (green).**
Coupling performance depends on the type of element selected (see **“Technical characteristics”**).
Other element hardnesses are available upon request to meet special operating conditions, such as high temperatures and/or high torques, and for providing a high degree of vibration dampening capability. Please contact our Engineering Office for help in selecting the appropriate element hardness.





Operation

When the polyurethane element is installed in its special seats between the hubs, it becomes precompressed, thereby providing the zero backlash feature which characterizes the transmission performance of this coupling.
With zero backlash, the coupling remains torsionally rigid within the range of the precompression load, but does permit the absorption of radial, angular, and axial misalignments as well as undesired vibrations.
The significantly wide precompressed area of the flexible element keeps the contact pressure against the elastic element low. Therefore, the element teeth can be overloaded many times without undergoing any wear or taking a permanent set.



Advantages

The TRASCO® ES coupling provides the following advantages:

- **"zero-backlash" motion transmission**
- **dampening** (up to 80%) **of vibrations** from motor shaft
- **low heat and electrical conductivity**
- **easy and fast installation**
- **perfect balance** (A & AP type)
- **low moment of inertia** (due to compact design and types of materials used).

Main applications

TRASCO® ES couplings are most frequently used with:

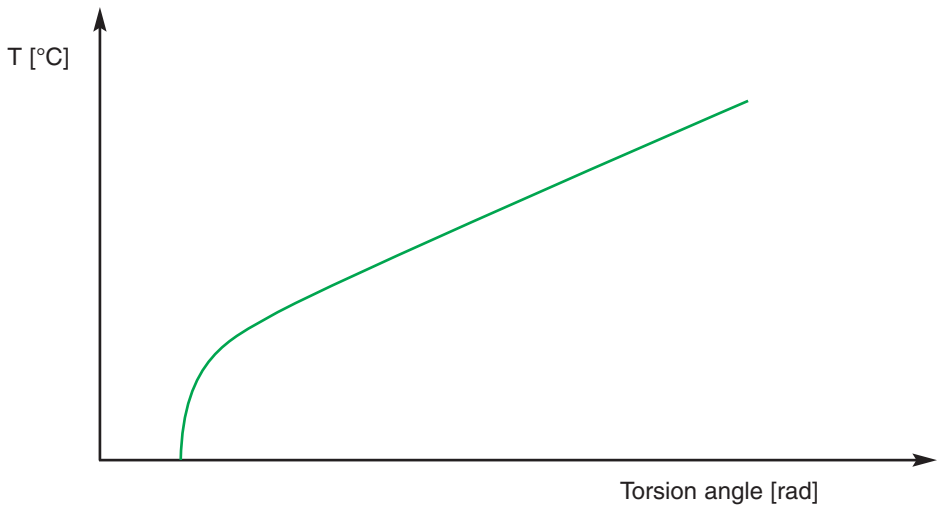
- servomotors
- robotics
- sliding tables
- spindle controls for drilling and grinding mandrels
- ball-bearing screws

Operating Temperature Range

The operating temperature range for the TRASCO® ES depends on the type of element. For the **92 Sh. A (yellow), the range is between -40 and +90 °C, and for the 98 Sh.A (red), the range is between -30 and +90 °C.** Peak temperatures as high as 120 °C can be tolerated for brief instances.
High operating temperatures can cause the elastic element to lose a considerable amount of elasticity, thus substantially lowering the torque handling capacity.
Therefore, when selecting a coupling, the operating temperature must be carefully considered (see **"Technical characteristics"**).

ATEX compliance

It is possible to ask for specific certification for use in hazardous area according to EC standard **94/9/EC**. TRASCO® ES couplings are available with specific mounting/operating instruction manual and conformity.
For information, please contact our technical office.



Technical characteristics

The following technical characteristics apply to all types of TRASCO® ES couplings.
When using the M, A and AP versions, check the torque values given in the table against the allowable hub transmission values for the respective versions given in the pertinent sections.
TRASCO® ES couplings can withstand axial, radial, and angular misalignment.

Even after operating for an extended period with a misalignment, there is still zero backlash because the elastic element is only stressed by pressure loads.
When an application causes a high degree of misalignment, a double flexing type coupling can be provided which avoids the formation of reaction forces.
Please contact our Engineering Office.

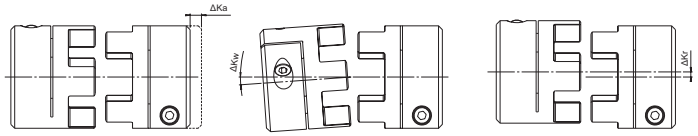
All the technical data in the catalogue are valid for rotation speeds of 1500 rpm and a working temperature of 30 °C.
For linear speed over 30 m/s, dynamic balancing is recommended.

Misalignments

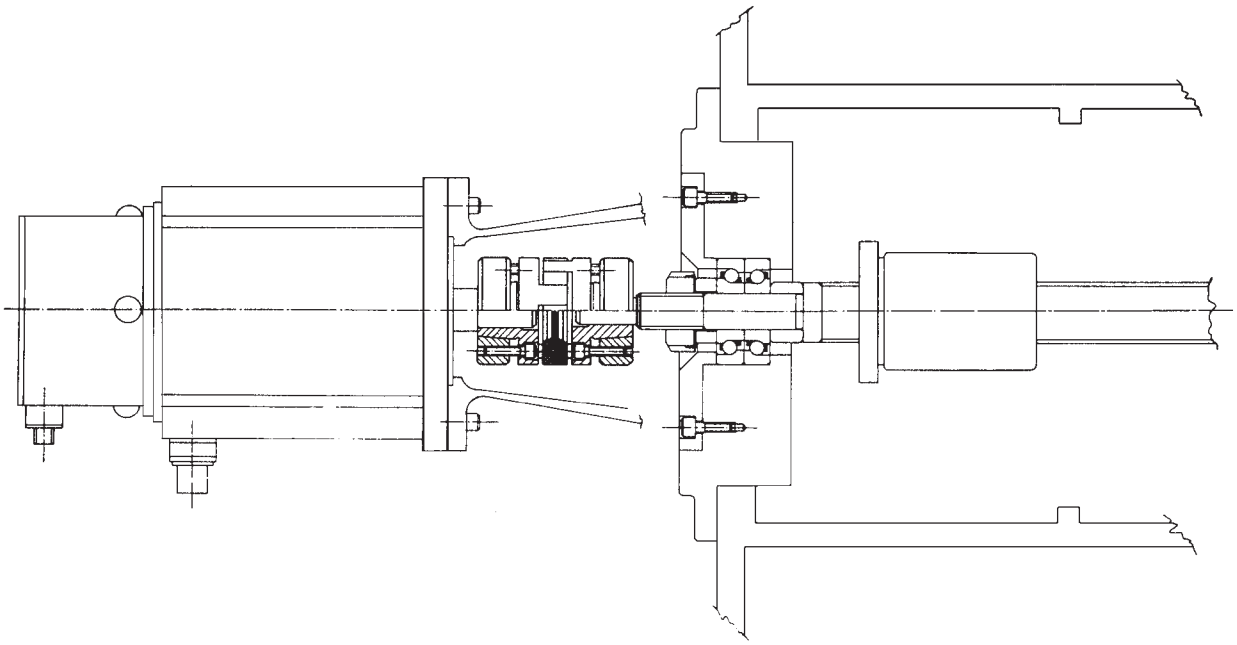


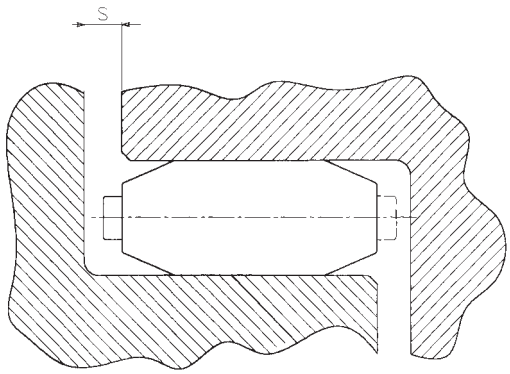
Axial Angular Radial

T_{KN}	Coupling nominal torque	Nm
T_{Kmax}	Coupling maximum torque	Nm
C_T	Torsional rigidity	Nm/rad
C_r	Radial stiffness	N/mm
ΔK_a	Maximum axial misalignment	mm
ΔK_r	Maximum radial misalignment	mm
ΔK_w	Maximum angular misalignment	°

Installation and maintenance

1. Carefully clean the shafts
2. Insert the hubs onto shafts being connected. With the M, A and AP versions, be sure to tighten the screws with the Ms torque value given in the catalogue. Be careful with the A and AP versions to tighten the screws uniformally and crosswise to the recommended torque
3. Position the element in one of the two coupling hubs
4. Fit together the two coupling halves, making sure the “s” dimension is properly observed. This must be done to insure proper elastic element function and long service life, as well as to assure the coupling is properly insulated electrically





With the A and AP versions, mounting the hubs can be facilitated by lubricating the shaft contact surfaces with an oil, but **do not use a molybdenum bisulphide based oils.**
When mounting the TRASCO® ES coupling an axial thrust is generated which disappears when the mounting has been completed to avoid putting axial loads on the bearings.

Lubrication of the elastic element will reduce the amount of axial force required during installation

Note: All rotating parts must be guarded.

Selection in according to DIN 740.2

The coupling must be chosen so the applied working loads do not exceed the allowable values whatever the working conditions are.

1. Check the load with respect to the nominal torque

The nominal coupling torque must be greater than or equal to the nominal torque of the drive machine for all working temperatures.

$$T_{KN} \geq T_K \cdot S_\theta \cdot S_D$$

2. Check the load with respect to the torque peak values

The maximum coupling torque must be greater than or equal to the torque peaks that occur during operation for all working temperatures.

$$T_{Kmax} \geq T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D$$

Motor-side peaks: $T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_A + T_L$ (1)

Driven-side peaks: $T_S = T_{LS} \cdot \frac{m}{m+1} \cdot S_L + T_L$ (1)

3. Check the load with respect to periodic torque inversions

By means of resonance

When the resonance frequency is passed rapidly below the operational interval a few torque peaks will be seen.
The generated alternating loads must be compared with the maximum torque the coupling can support.

$$T_{Kmax} \geq T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D$$

Motor-side peaks: $T_S = T_{AI} \cdot \frac{1}{m+1} \cdot V_R + T_L$ (1)

Driven-side peaks: $T_S = T_{LI} \cdot \frac{m}{m+1} \cdot V_R + T_L$ (1)

4. Check the load with respect to nonperiodic torque inversions

To check the load with respect to nonperiodic torque inversions, the following equations must be satisfied:

$$0{,}25\ T_{KN} = T_{KW} \geq T_W \cdot S_\theta \cdot S_f \cdot S_D$$

Motor-side peaks: $T_W = T_{AI} \cdot \frac{1}{m+1} \cdot V_{fi}$

Driven-side peaks: $T_W = T_{LI} \cdot \frac{m}{m+1} \cdot V_{fi}$

(1) T_L to be added if a torque peak occurs during acceleration.

Calculation coefficients

S_θ = Temperature factor

Light	1,5
Medium	1,8
Strong	2,2

V_{fi} = Torque-Amplification factor = $\sqrt{\frac{1+\left(\frac{\psi}{2\pi}\right)^2}{\left(1-\frac{n^2}{n_R^2}\right)^2+\left(\frac{\psi}{2\pi}\right)^2}}$

n_R = Resonance frequency = $\frac{30}{\pi}\sqrt{C_{Tdin}\frac{J_A+J_L}{J_A \cdot J_L}}\ \left[\text{min}^{-1}\right]$

m = Mass factor = $\frac{J_A}{J_L}$

Example of selection

Application

Servomotor driving a recirculating ball screw on a machine tool

Nominal Torque	T_K = 10,0 Nm	Shock Type	Light
Peak Torque	T_{AS}= 22,0 Nm	Table Moment of Inertia	J_3 = 0,0038 kg·m²
Rpm	n = 3.000 1/min	Driven Shaft	dc = 20 mm h6 (without keyway)
Moment of Inertia	J_1 = 0,0058 kg·m²	Motor Shaft	dm = 24 mm h6 (without keyway)
Temperature	T = +40°C		

Selection

24/28 "A" type ES coupling with "Red" elastic element (98 Sh. A)

Standard coupling torque:	T_{KN} = 60 [Nm]
Maximum torque:	T_{Kmax} = 120 [Nm]
Hub Moment of Inertia:	J_2 = 0,000135 [kg·m²]
Couple Transmitted by taper locking ring:	Tcal = { 92 [Nm] bore 20 [mm]; 113 [Nm] bore 24 [mm]

Load check

$$T_{KN} = T_K \cdot S_\theta \cdot S_D = 10 \cdot 1{,}2 \cdot 4 = 48{,}0 \text{ [Nm]}$$

$$T_{KN} = 48{,}0 \text{ Nm} < T_{cal}$$

$$m = \frac{J_A}{J_L} \qquad J_A = J_1 + J_2 \qquad J_L = J_3 + J_2 \qquad m = 1{,}5$$

$$T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_A = 22{,}0 \cdot \frac{1}{1{,}5+1} \cdot 1{,}5 = 13{,}2 \text{ [Nm]}$$

$$T_{Kmax} = T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D = 13{,}2 \cdot 1{,}6 \cdot 1{,}2 + 12{,}5 \cdot 1{,}2 \cdot 4 = 85{,}34 \text{ [Nm]}$$

$$T_{Kmax} = 85{,}34 \text{ Nm} < T_{cal}$$

T_{KN}	Coupling nominal torque	Nm

TRASCO® ES executions

FINISHED BORE HUBS EXECUTION

GES F execution

From size 7 to 9.
Hub execution with finish bores, and two setscrew.

GES F C execution

From size 14.
Hub execution with finish bore, keyway and setscrew. Not suitable for backlash free drives with high reversing frequency or high start-tup frequency.

CLAMP HUBS EXECUTION

GES M execution

Clamping hub execution with single slot without keyway. Up to size 19/24. Backlash free hub design. Transmissible torque depends on bore diameter.

GES M execution

Clamping hub execution with double slot without keyway. From size 24/28. Backlash free hub design. Transmissible torque depends on bore diameter.

GES M...C execution

Camping hub execution with single slot and keyway. Up to size 19/24. The clamping pressure eliminates backlash in torque reversals.

GES M...C execution

Camping hub execution with double slot and keyway. From size 24/28. The camping pressure eliminates backlash in torque reversals.

GES 2M execution

Split camping hub execution for radial assembly of the coupling Torque depends on bore diameter. Execution “C” with keyway, as option can be delivered for a positive torque transmission with zero backlash. These executions are suitable for double cardanic applications.

SHRINK DISC EXECUTION

GES A execution

Execution with locking ring. This execution is suitable for high speed and high torque. Screws mounting from spider side. Transmissible torque depends on bore diameter.

GES AP execution

Execution with locking ring with high machining accuracy: design suitable for application on spindles according to DIN 69002.

Standard type

SIT coupling hubs are available from stock with either solid hub or with finished bores of standard shaft diameters.
The setscrews of our finished bore execution are positioned 120 degrees from each other with one positioned 180 degrees from the keyway. Both the solid hub and bored hub coupling are generally available from stock for quick delivery.
Approved according to EC standard ATEX.

“A” type - Shrink disc execution

This type of coupling provides excellent kinetic uniformity. Furthermore, the absence of keys or set screws makes it a well-balanced coupling and greatly facilitates installation and removal. An exact radial/axial positioning is easy for those applications which require it. The absence of keyways also avoids fretting corrosion and backlash between the shaft and the hub. This is the ideal type of coupling for applications requiring precision and/or high rotational speeds.
Approved according to EC standard ATEX.

“AP” type - Shrink disc execution according to DIN 69002

Precision “zero-backlash” coupling designed for multi spindle devices on machine tools or controls with reduced mass, such as short center spindles, multi-centers primary spindles in work stations, or joined to high speed bearings with limited tolerance range. It is suitable for very high speeds of rotation (up to speeds of 50 m/s).

“GESS” double cardanic execution

This execution allows higher misalignments. The 2 spiders allow a high vibration dampening providing a decrease in drive noise and longer life of related components (ex. bearings).

The intermediate element is made of aluminum alloy and may be used in combination with any type of hub execution.

“GES LR1” execution with intermediate shaft

This zero backlash execution, allows connection to long distance shafts in applications such as lifting screw jacks, gantry robot etc. The intermediate shaft is made of steel but may be of different material for specific need.
The presence of 2 spiders, increases the dampening properties and allow high misalignments.

“GES LR3” execution with intermediate shaft

Ideal execution for long distance shaft connections. Torque transmission is zero backlash. It is used in applications such as automatic machines, lifting machines, palletizing machines, and handling machines. Designed for length up to 4 m without bearing support (depending on rotation speed). The double slot execution, allows spider mounting and replacement without driver/driven machine displacement. All aluminum alloy for a very low inertia.

Technical data for intermediate shaft couplings (GES LR1 - GES LR3)

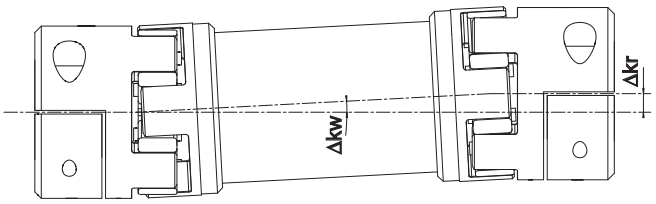
Size	Misalignment	
	Assial ΔK_a [mm]	Angular ΔK_w [°]
14	1,0	0,9
19/24	1,2	0,9
24/28	1,4	0,9
28/38	1,5	0,9
38/45	1,8	0,9

Angular misalignment = 0,9° per spider

$$C_{Tot} = \frac{1}{2 \cdot \frac{1}{C_{T\,spider}} + \frac{L_{intermediate\ shaft}}{C_{T\,intermediate\ shaft}}} \quad [Nm/rad]$$

$$L_{intermediate\ shaft} = \frac{L_{zw} - 2 \cdot L}{1000} \quad [mm]$$

with L_{zw} = total coupling length



Radial misalignment

$$\Delta Kr = (L_z - 2 \cdot H - M) \cdot \tan(\Delta Kw) \quad [mm]$$
